

You Don't Need Better Predictions.

You Need a Better Framework.

A momentum-based, regime-aware portfolio management framework combining systematic stock selection, market regime controls, and equal-weight construction to deliver consistent risk-adjusted returns regardless of which companies or sectors lead the market at any given time.

MOMENTUM-BASED
20 STOCKS · EQUAL WEIGHT
QUARTERLY REBALANCING
REGIME-AWARE

Most investors fail not from a lack of information, but from a lack of framework describing themselves as long-term while losing discipline through volatility or taking gains prematurely. **The objective is not to predict outcomes. It is to maintain consistent alignment between portfolio risk and prevailing market dynamics through structured, repeatable execution.** Inspired by index discipline: all investment styles ultimately depend on the same mechanism price appreciation. Without momentum, returns cannot be realized.

THE FOUR CORE DECISION VARIABLES

DECISION VARIABLE 01	DECISION VARIABLE 02	DECISION VARIABLE 03	DECISION VARIABLE 04
When to Buy Conditioned on market regime and trend stability. Avoid initiating exposure during unfavorable environments broad market pressure consistently overwhelms individual stock strength. Entry is earned, not assumed. REGIME FIRST	What to Buy Determined by momentum and relative strength. Capital is allocated only to assets already being rewarded by the market. The focus is on confirming persistent positive price behavior not predicting future winners. MOMENTUM CONFIRMED	How Much to Buy Guided by risk and volatility. Position sizes remain appropriate as volatility changes. Equal weighting across 20 holdings prevents any single position from dominating portfolio outcomes concentration is a risk, not a virtue. RISK-SIZED	When to Sell Driven by deterioration in momentum or systematic rebalancing requirements. Never by emotion, prediction, or conviction. Discipline at exit is the framework's most critical and most frequently violated variable. SYSTEMATIC EXIT

MARKET REGIME CONTROL STOCK SELECTION PROCESS

MARKET REGIME CONTROL

● FAVOURABLE Full Deployment Trend stable. Momentum reliable. Deploy capital. Screen for strongest relative strength.	● TRANSITIONAL Selective Exposure Mixed signals. Leadership rotating. Limit new entries. Monitor for deterioration.	● UNFAVOURABLE Reduce / Exit Trends breaking down. Reduce or fully exit. Capital preservation priority.
---	---	---

STOCK SELECTION PROCESS

- 1

Screen for Momentum & Relative Strength

Identify stocks where **positive price behaviour is persistent and confirmed** not predicted. Capital goes only to assets the market is already rewarding.
- 2

Filter Extreme Greed & Overcrowding

Remove **late-stage momentum** where upside is asymmetric to downside. Participate without chasing speculative extremes.
- 3

Confirm Regime Support

Only proceed if the **market environment sustains momentum**. Individual stock strength cannot overcome broad market deterioration regime is the gate.
- 4

Construct at Equal Weight

Select **20 stocks at 5% each**. Index-style discipline without sacrificing momentum exposure. Rebalance at minimum quarterly more frequently if regime shifts.

FRAMEWORK VS. TRADITIONAL APPROACHES

FACTOR	PREDICTION-BASED	THIS FRAMEWORK
Primary Focus	Forecasting future winners	Confirming current momentum
Market Exposure	Always invested regardless	Regime-conditional deployment
Sell Discipline	Emotion, gut feel, conviction	Systematic momentum deterioration
Construction	High-conviction concentration	Equal weight, 20 positions
Rebalancing	Infrequent, resisted	Structured, minimum quarterly
Stock Selection	Analyst forecasts & narratives	Price behaviour & relative strength
Behavioural Risk	High emotion drives decisions	Mitigated by rules-based process
Adaptability	Static shaped by past outcomes	Dynamic aligns to current risk

Key Insight: All investment styles value, growth, technical share a single outcome requirement: price appreciation. Investors are rewarded not when a company improves, but when that improvement is reflected in its stock price. **Without momentum, returns cannot be realized.** This framework makes momentum the primary signal across all conditions.

PORTFOLIO HOLDINGS	POSITION SIZE	REBALANCING FREQUENCY	CORE SELECTION SIGNAL
20 Equal-weighted positions. No single stock dominates outcomes.	5% Per holding. Concentration risk eliminated by design.	Quarterly Minimum. Triggered earlier if regime shifts or momentum breaks.	Momentum Relative strength confirmed. No forecasts. Price leads.
